Attempt : 1
Total Mark : 10
Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

Your task is to create a program to manage a playlist of items. Each item is represented as a character, and you need to implement the following operations on the playlist.

Here are the main functionalities of the program:

Insert Item: The program should allow users to add items to the front and end of the playlist. Items are represented as characters.Display Playlist: The program should display the playlist containing the items that were added.

To implement this program, a doubly linked list data structure should be used, where each node contains an item character.

Input Format

The input consists of a sequence of space-separated characters, representing the items to be inserted into the doubly linked list.

The input is terminated by entering - (hyphen).

Output Format

The first line of output prints "Forward Playlist: " followed by the linked list after inserting the items at the end.

The second line prints "Backward Playlist: " followed by the linked list after inserting the items at the front.

Refer to the sample output for formatting specifications.

Sample Test Case

Input: a b c -
Output: Forward Playlist: a b c
Backward Playlist: c b a

Answer

```
#include <stdio.h>
#include <stdlib.h>

struct Node {
    char item;
    struct Node* next;
    struct Node* prev;
};

void insertAtEnd(struct Node** head, char item) {
    struct Node* newNode = (struct Node*)malloc(sizeof(struct Node));
    newNode->item = item;
    newNode->next = NULL;
    newNode->prev = NULL;

    // If the list is empty, the new node becomes both the head and the tail
    if (*head == NULL) {
        *head = newNode;
    } else {
```

```
        struct Node* temp = *head;
        // Traverse to the last node
        while (temp->next != NULL) {
            temp = temp->next;
        }
        // Insert the new node at the end
        temp->next = newNode;
        newNode->prev = temp;
    }
}

// Function to display the playlist from head to tail (forward order)
void displayForward(struct Node* head) {
    struct Node* temp = head;
    while (temp != NULL) {
        printf("%c ", temp->item);
        temp = temp->next;
    }
    printf("\n");
}

// Function to display the playlist from tail to head (backward order)
void displayBackward(struct Node* tail) {
    struct Node* temp = tail;
    while (temp != NULL) {
        printf("%c ", temp->item);
        temp = temp->prev;
    }
    printf("\n");
}

// Function to free the memory allocated for the playlist
void freePlaylist(struct Node* head) {
    struct Node* temp;
    while (head != NULL) {
        temp = head;
        head = head->next;
        free(temp);
    }
}
int main() {
    struct Node* playlist = NULL;
```

```
    char item;

    while (1) {
        scanf(" %c", &item);
        if (item == '-') {
            break;
        }
        insertAtEnd(&playlist, item);
    }

    struct Node* tail = playlist;
    while (tail->next != NULL) {
        tail = tail->next;
    }

    printf("Forward Playlist: ");
    displayForward(playlist);

    printf("Backward Playlist: ");
    displayBackward(tail);

    freePlaylist(playlist);

    return 0;
}
```
