Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

Ashwin is tasked with developing a simple application to manage a list of items in a shop inventory using a doubly linked list. Each item in the inventory has a unique identification number. The application should allow users to perform the following operations:

Create a List of Items: Initialize the inventory with a given number of items. Each item will be assigned a unique number provided by the user and insert the elements at end of the list.

Delete an Item: Remove an item from the inventory at a specific position.

Display the Inventory: Show the list of items before and after deletion.

If the position provided for deletion is invalid (e.g., out of range), it should

display an error message.

Input Format

The first line contains an integer n, representing the number of items to be initially entered into the inventory.

The second line contains n integers, each representing the unique identification number of an item separated by spaces.

The third line contains an integer p, representing the position of the item to be deleted from the inventory.

Output Format

The first line of output prints "Data entered in the list:" followed by the data values of each node in the doubly linked list before deletion.

If p is an invalid position, the output prints "Invalid position. Try again."

If p is a valid position, the output prints "After deletion the new list:" followed by the data values of each node in the doubly linked list after deletion.

Refer to the sample output for the formatting specifications.

Sample Test Case

Input: 4
1 2 3 4
5
Output: Data entered in the list:
node 1 : 1
node 2 : 2
node 3 : 3
node 4 : 4
Invalid position. Try again.

Answer

```
#include <iostream>
using namespace std;
```

```
// Node structure
struct Node {
    int data;
    Node* prev;
    Node* next;
};

// Insert at end
void insertAtEnd(Node*& head, Node*& tail, int value) {
    Node* newNode = new Node;
    newNode->data = value;
    newNode->prev = nullptr;
    newNode->next = nullptr;

    if (head == nullptr) {
        head = tail = newNode;
    } else {
        tail->next = newNode;
        newNode->prev = tail;
        tail = newNode;
    }
}

// Display list with node numbers
void displayList(Node* head) {
    Node* temp = head;
    int count = 1;
    while (temp != nullptr) {
        cout << " node " << count << " : " << temp->data << endl;
        temp = temp->next;
        count++;
    }
}

// Delete node at given position
bool deleteAtPosition(Node*& head, Node*& tail, int pos, int n) {
    if (pos < 1 || pos > n) return false;

    Node* temp = head;
    int count = 1;

    // Traverse to the node at the given position
```

```
    while (temp != nullptr && count < pos) {
        temp = temp->next;
        count++;
    }

    if (temp == nullptr) return false;

    // Handle head deletion
    if (temp == head) {
        head = head->next;
        if (head != nullptr) head->prev = nullptr;
        else tail = nullptr; // If list becomes empty
    }
    // Handle tail deletion
    else if (temp == tail) {
        tail = tail->prev;
        tail->next = nullptr;
    }
    // Handle middle node deletion
    else {
        temp->prev->next = temp->next;
        temp->next->prev = temp->prev;
    }

    delete temp;
    return true;
}

int main() {
    int n;
    cin >> n;

    Node* head = nullptr;
    Node* tail = nullptr;

    // Read the inventory items
    for (int i = 0; i < n; ++i) {
        int value;
        cin >> value;
        insertAtEnd(head, tail, value);
    }
```

```
    int pos;
    cin >> pos;

    // Display before deletion
    cout << "Data entered in the list:" << endl;
    displayList(head);

    // Try to delete
    if (pos < 1 || pos > n) {
        cout << "Invalid position. Try again." << endl;
    } else {
        deleteAtPosition(head, tail, pos, n);
        cout << "\n After deletion the new list:" << endl;
        displayList(head);
    }

    return 0;
}
```

Status : Correct **Marks : 10/10**
