Section 1: Coding

1. Problem Statement

Ravi is developing a student registration system for a college. To efficiently store and manage the student IDs, he decides to implement a doubly linked list where each node represents a student's ID.

In this system, each student's ID is stored sequentially, and the system needs to display all registered student IDs in the order they were entered.

Implement a program that creates a doubly linked list, inserts student IDs, and displays them in the same order.

Input Format

The first line contains an integer N the number of student IDs.

The second line contains N space-separated integers representing the student IDs.

Output Format

The output should display the single line containing N space-separated integers representing the student IDs stored in the doubly linked list.

Refer to the sample output for formatting specifications.

Sample Test Case

```
Input: 5
   10 20 30 40 50
Output: 10 20 30 40 50
   Answer
   #include <iostream>
   using namespace std;
   // Node structure for the doubly linked list
   struct Node {
      int studentID;
      Node* prev:
      Node* next;
   // Function to insert at the end of the list
   void insertAtEnd(Node*& head, Node*& tail, int id) {
      Node* newNode = new Node;
      newNode->studentID = id:
      newNode->prev = nullptr;
      newNode->next = nullptr;
      if (head == nullptr) {
        // First node in the list
        head = tail = newNode:
      } else {
      // Add at the end
        tail->next = newNode;
        newNode->prev = tail;
```

```
tail = newNode;
                                                                                240707504
                                                      240701504
     // Function to display the list
     void displayList(Node* head) {
       Node* temp = head;
       while (temp != nullptr) {
         cout << temp->studentID << " ";
         temp = temp->next;
       }
       cout << endl;
     // Main function
 int main() {
       int N;
       cin >> N;
       Node* head = nullptr;
       Node* tail = nullptr;
       for (int i = 0; i < N; ++i) {
         int id;
          cin >> id;
         insertAtEnd(head, tail, id);
       displayList(head);
       return 0;
     }
     Status: Correct
                                                                         Marks: 10/10
